

Project design Phase

Proposed Solution

Date	28-06-2026
Project Name	Automated Network Request Management
Team ID	
Maximum Marks	

Proposed Solution:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Modern enterprises face severe delays, human errors, and limited visibility when handling network-related requests (like access provisioning or firewall changes) through traditional manual email chains and unstructured ticketing.
2.	Idea / Solution description	An automated, end-to-end ServiceNow solution featuring a custom self-service catalog. The interface utilizes a premium, minimalist design with clean typography to ensure an intuitive, professional user experience. It captures details via dynamic forms, triggers automated multi-tier approval workflows, and instantly assigns fulfillment tasks to the correct IT group.

3.	Novelty/ Uniqueness	Replaces static IT forms with dynamic Catalog UI Policies that auto-populate user data and intelligently hide irrelevant fields. It leverages Flow Designer to create a "zero-touch" routing system that manages approvals and database updates without manual IT intervention.
4.	Social Impact / Customer Satisfaction	Eliminates the anxiety and frustration of the IT "black hole" by providing users with instant, automated email updates regarding their request status. It ensures faster network access, allowing employees to stay productive, while freeing IT staff from repetitive administrative tasks.
5.	Business Model (Revenue Model)	Operational Cost Reduction (Internal ROI): As an IT Service Management (ITSM) tool, the value is generated by reducing the manual labor hours spent on ticket triage, accelerating SLA resolution times, and minimizing the financial loss associated with employee downtime.
6.	Scalability of the Solution	Built on a modular Flow Designer architecture and a scalable custom backend database table. As the organization grows, the system can seamlessly accommodate new device types, complex security approval chains, or direct integrations with external network orchestration tools without requiring a complete rebuild.
