

Ideation Phase

Brainstorm & Idea Prioritization

Date	28-06-2026
Project Name	Automated Network Request Management
Team ID	
Maximum Marks	

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Before diving into ideas, it is essential to define the core focus and the right participants.

- **Problem Statement (How Might We):** How might we implement a fully automated and scalable network change management process in ServiceNow to ensure rapid fulfillment, audit-ready change records, and accurate configuration tracking?
- **Team Gathering:** To tackle this, the session should include network engineers, ServiceNow administrators, IT support staff, and a dedicated UI/UX perspective to ensure the catalog forms are clean, modern, and user-friendly.

Step-2: Brainstorm, Idea Listing and Grouping

Here is a list of brainstormed ideas clustered into related sub-groups based on the project milestones.

Cluster 1: Catalog Taxonomy & Form Experience

- Create distinct service catalog items with clear titles and descriptions for specific network needs (e.g., VPN Access, Port Activation, Firewall Rule Change).
- Design dynamic behaviors to show or hide fields based on user selection, keeping the initial interface minimalist and preventing information overload.
- Include mandatory fields strategically to reduce incomplete submissions without frustrating the user.
- Ensure the catalog taxonomy aligns perfectly with the existing ITSM structure so users intuitively know where to find the forms.

Cluster 2: Automated Workflows & Approvals

- Configure approval steps using Flow Designer to automatically route requests to the appropriate personnel.
- Identify and implement required multi-level approval chains, such as requiring both manager and network security sign-off for high-risk requests.
- Enable automated email notifications at every stage so the user is always aware of their request status.
- Ensure rigorous audit logging is enabled to track who approved what and when.

Cluster 3: Quality Assurance & Launch Strategy

- Perform isolated unit testing on each individual catalog item before connecting the flows.
- Conduct end-to-end request simulations using multiple edge-case scenarios to validate data accuracy.
- Involve key stakeholders in User Acceptance Testing (UAT) to log defects and iterate on improvements before going live.
- Finalize a deployment checklist and set up a dedicated support process for any post-deployment issues.

Step-3: Idea Prioritization

To determine which ideas are important and feasible, they are mapped onto an Importance vs. Feasibility grid.

Priority Level	Idea / Task	Justification
High Importance, High Feasibility (<i>Do Now</i>)	Build catalog item forms using variables and include mandatory fields.	Essential for capturing request data and structurally straightforward to implement in ServiceNow.
High Importance, High Feasibility (<i>Do Now</i>)	Configure standard manager approval steps using Flow Designer.	Critical for compliance and control; utilizes out-of-the-box Flow Designer actions.
High Importance, Low Feasibility (<i>Plan Carefully</i>)	Add dynamic behaviors (show/hide fields based on selection).	Highly valuable for the user experience, but requires careful mapping of UI Policies to avoid conflicting logic.
High Importance, Low Feasibility (<i>Plan Carefully</i>)	Conduct end-to-end request simulations with multiple scenarios.	Crucial for validating the lifecycle, but time-consuming to map out every possible user path.
Low Importance, High Feasibility (<i>Quick Wins</i>)	Create service catalog items with clear titles and descriptions.	Easy to execute and immediately improves catalog taxonomy and user discovery.
