

Requirement Analysis

Solution Requirements (Functional & Non-functional)

Date	28-06-2026
Project Name	Automated Network Request Management
Team ID	
Maximum Marks	

Functional Requirements

These are the specific behaviors, features, and functions your ServiceNow system must perform based on your workflow design.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Service Catalog & Form Submission	Portal access to the "Network Request" item
		Auto-population of user details (Email, Phone, Name) based on "Opened on behalf of"
		Dynamic form fields (Catalog UI Policies) to hide/show specific fields like "Please specify"

FR-2	Backend Record Management	Automatic creation of a record in the custom <code>u_network_database_table</code> upon submission
		Status tracking and updating (e.g., New, In Progress, Closed Complete)
FR-3	Automated Approval Workflow	Dynamic routing of the request to the designated Manager/Approver
		System pausing fulfillment until an Approve or Reject decision is logged
FR-4	Automated Notifications	Triggering an initial confirmation email with the REQ tracking number
		Triggering a final resolution email once the IT fulfiller completes the network setup

Non-functional Requirements

These define the system's operational attributes—how well the system performs its functions. Since you are building on the ServiceNow platform, you inherit many of these automatically, but they must still be documented.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The self-service portal must feature a clean, intuitive, and dynamic UI so non-technical employees can easily submit network requests without confusion.
NFR-2	Security	Role-based access control must be enforced: only authorized Managers can approve requests, and only IT Fulfillers/Admins can view or modify the backend database records.
NFR-3	Reliability	The Flow Designer automation must consistently route approvals and update database statuses without dropping tasks or missing email triggers.
NFR-4	Performance	Catalog UI Policies and auto-population scripts must execute instantly on the client side (under 1-2 seconds) to ensure a seamless form-filling experience.
NFR-5	Availability	The ServiceNow Service Portal must be highly available (24/7) allowing employees to submit critical network requests at any time.

NFR-6	Scalability	The custom table and Flow Designer logic must be built modularly, allowing the IT team to easily add new device types, approval tiers, or complex network configurations in the future without rebuilding the flow.
